	Embedding is a	25. 25
	class that	26. 26
	represents an	27. 27
	embedding	28. 28
	layer. It accepts	29. 29
	token indices	30. 30
	and produces	31. 31
	embedding	32. 32
	vectors.	33. 33
	EmbeddingBag	34. 34
	is a class that	35. 35
	aggregates	36. 36
		37. 37
		38. 38
PyTorch/Embedding and EmbeddingBag	embeddings using mean or sum operations. Embedding and EmbeddingBag are part of the torch.nn module. The code example shows how you can use Embedding and EmbeddingBag in PyTorch.	1. # Defining a data set 2. dataset = [ 3. "I like cats", 4. "I hate dogs", 5. "I'm impartial to hippos" 6. ] 7. #Initializing the tokenizer, iterator from the data set, and vocabulary 8. tokenizer = get_tokenizer('spacy', language='en_core_web_sm') 9. def yield_tokens(data_iter): 10.     for data_sample in data_iter: 11.         yield tokenizer(data_sample) 12. data_iter = iter(dataset) 13. vocab = build_vocab_from_iterator(yield_tokens(data_iter)) 14. #Tokenizing and generating indices 15. input_ids=lambda x:[torch.tensor(vocab(tokenizer(data_sample)))) for data_sample in dataset] 16. index=input_ids(dataset) 17. print(index) 18. #Initiating the embedding layer, specifying the dimension size for the embeddings, 19. #determining the count of unique tokens present in the vocabulary, and creating the embedding layer 20. embedding_dim = 3 21. n_embedding = len(vocab) 22. n_embedding:9 23. embeds = nn.Embedding(n_embedding, embedding_dim) 24. #Applying the embedding object 25. i_like_cats=embeds(index[0]) 26. i_like_cats 27. impartial_to_hippos=embeds(index[-1]) 28. impartial_to_hippos 29. #Initializing the embedding bag layer 30. embedding_dim = 3 31. n_embedding = len(vocab) 32. n_embedding:9 33. embedding_bag = nn.EmbeddingBag(n_embedding, embedding_dim) 34. # Output the embedding bag 35. dataset = ["I like cats","I hate dogs","I'm impartial to hippos"] 36. index:[tensor([0, 7, 2]), tensor([0, 4, 3]), tensor([0, 1, 6, 8, 5])] 37. i_like_cats=embedding_bag(index[0],offsets=torch.tensor([0])) 38. i_like_cats
